New Pre-Lubricated Bearing Designed for High Impact Loads

Waukegan, IL — Peer, Inc. announced today the launch of a new steel-backed plain bearing, the FR 010. Also known as the “POM” Bearing, FR 010 is the latest in Peer’s expanding F-Series of plain type bearings.

Manufactured by Peer’s strategic partner, NDC Co. Ltd., of Japan, FR 010 starts with a steel backing sintered with a porous lead-bronze layer. This layer is impregnated with a polyacetal resin. The bearing’s surface has a series of ball indents (oil reservoirs) spaced at specified intervals. These indents retain lubricant and help to distribute it evenly around the bearing surface.

The result is a bearing that is able to handle high impact loads and has a high tolerance for misalignments that may occur during installation or heavy oscillation. FR 010 maintains a very low level of friction and almost no wear if supplied with a small amount of grease or oil.

FR 010 is available immediately as a bushing in sizes from 1/2” to 3” inner diameter. Prices start at \$0.25 each depending upon order quantities. Larger sizes and or customer designs specifications can effect final cost.

Peer, Inc. is a market leader in the manufacture and development of self lubricated bearings and associated products used in dry, semi-lubricated and fully lubricated environments.
